GSMR

Generalised Summary-data-based Mendelian Randomisaion

GCTA SMR

GSMR OSCA

GCTB

Program in CTG

CTG forum

Overview

The **gsmr** R-package

implements the GSMR (Generalised Summary-data-based Mendelian Randomisation) method to

test for putative causal association between a risk factor and a disease using

summary-level data from genome-wide association studies (GWAS) (Zhu et al. 2018

Nat. Commun.). The R package is developed by Zhihong Zhu, Zhili Zheng, Futao Zhang

and Jian Yang at Institute for Molecular Bioscience, the University of Queensland. Bug reports or

questions:

jian.yang@uq.edu

Note: The GSMR method has also been implemented in the GCTA

software (GCTA-GSMR)

Citation

Zhu, Z. et al. (2018) Causal

associations between risk factors and common diseases inferred from GWAS summary

data. Nat. Commun. 9, 224 (https://www.natu 017-02317-2).

Source code

gsmr_1.0.9.tar.gz

Note: We included a new HEIDI-outlier method (as part of the GSMR

analysis) in gsmr v1.0.7. However, the new HEIDI-outlier method is currently under development

and subject to changes during the method development. From the GSMR R package (>=

version 1.0.8), we changed the default back to the original HEIDI-outlier method described in Zhu et

al. (2018 Nature Communications) and added a temporary flag ('gsmr2_beta') to test the

new method. The command to use this flag can be found in the tutorial below. The new HEIDI-outlier

method in gsmr (>= version 1.0.8) has been tested by extensive simulations and real data

analyses. We will make a formal release in our next GSMR paper.

Sample data are available in

test_data.zip.

This document has been integrated in the gsmr R-package, we can check it

by the standard command “?function_name” in R.

Installation

The **gsmr**

requires R >= 2.15, you can install it in R by:

```
# gsmr req
uires the
R-package(
s)
install.pa
```

```
ckages(c('
survey'));
# install
gsmr
install.pa
ckages("ht
tp://cnsge
nomics.com
/software/
gsmr/stati
c/gsmr_1.0
```

```
.9.tar.gz
,repos=NUL
L,type="so
urce")
```

Update log

V1.0.9

(gmr_1.0.9.tar.gz

PDF, 18 Jun. 2019): Change the flag ‘gsmr_beta’ to ‘gsmr2_beta’.

V1.0.8

(gmr_1.0.8.tar.gz PDF, 21 Jan. 2019): Added a flag ‘gsmr_beta’ to use a testing version of the

HEIDI-outlier method.

V1.0.7 (gmr_1.0.7.tar.gz PDF, 9 Oct. 2018): Added a multi-SNP-

based HEIDI-outlier test in the HEIDI-outlier analysis.

V1.0.6 (gmr_1.0.6.tar.gz PDF, 23

Jan. 2018):

Added a function to remove SNPs in high LD.

V1.0.5 (gmr_1.0.5.tar.gz PDF, 13

Dec. 2017): Improved the approximation of the sampling covariance matrix.

V1.0.4

(gsmr_1.0.4.tar.g
PDF, 6
Nov. 2017):
Added the bi-
directional
GSMR
analysis. The
HEIDI-outlier

analysis has been integrated in the GSMR analysis by default.

V1.0.3 (gsmr_1.0.3.tar.g

PDF, 12 Oct. 2017): Added more example data.

Removed the initial versions (8 Nov 2016).

Tutorial

The GSMR analysis only requires summary-level data from GWAS.

Here is an example, where the risk factor (x) is LDL cholesterol (LDL-c) and the disease (y)

is coronary artery disease (CAD). GWAS summary data for both LDL-c and CAD are available in the public

domain (Global Lipids Genetics Consortium et al. 2013, Nature Genetics; Nikpay, M. et

al. 2015, Nature Genetics).

1. Prepare data for GSMR

analysis

1.1 Load the GWAS summary data

```
library("gsmr")
data("gsmr")
head(gsmr_data)
```

```
##
SNP a1 a2

## [1] 18812
```

This is the input format

for the GSMR analysis. In this data set, there are 188 near-independent SNPs associated

with LDL-c at a genome-wide significance level (i.e. $p < 5e-8$).

- SNP: the genetic

instrument

- a1: effect allele
- a2: the other allele
- a1_freq: frequency of a1
- bzx: the

effect size of a1 on risk factor

- bzx_se: standard error of bzx
- bzx_pval: p value for bzx

- bzx_n: per-SNP sample size of GWAS for the risk factor
- bzy: the effect size

of a1 on disease

- bzy_se: standard error of bzy
- bzy_pval: p value for bzy
- bzy_n: per-

SNP sample size of GWAS for the disease

1.2 Estimate the LD correlation matrix

```
# Save the genetic variants and effect alleles in a text file using R
write.table(gsmr_data[,c(1,2)], "gsmr_ex
```

```
ample_snps
.allele",
col.names=
F, row.nam
es=F, quot
e=F)
# Extract
the genoty
pe data fr
om a GWAS
dataset us
ing GCTA
```

```
img GCTA
gcta64 --b
file gsmr_
example --
extract gs
mr_example
_snps.alle
le --updat
e-ref-alle
le gsmr_ex
ample_snps
.allele --
```

```
recode --o
ut gsmr_ex
ample
```

Note: the two steps above guarantee that the LD correlations

are calculated based on the effect alleles for the SNP effects.

```
# Estimate LD correlation matrix using R

Note: all the analyses implemented in this R-package only require the summary data (e.g. “gsmr_data”

and the LD correlation matrix (e.g. “ldrho”) listed above.

2. Standardiza

This is an optional process. If the risk factor was not standardised in GWAS, the effect sizes

can be scaled using the method below. Note that this process requires allele frequencies,

z-statistics and sample size. After scaling, bzx is interpreted as the per-allele effect of a SNP on the

exposure in standard deviation units.

```
snpfreq = gsmr_data$a1_freq # allele frequencies
```

```
of the SNP
s
bzx = gsmr
_data$bzx
# effects

3. GSMR analysis

This is the

main analysis of this R-package. It uses SNPs associated with the risk factor (e.g. at $p < 5e-8$) as

the instruments to test for putative causal effect of the risk factor on the disease. The

analysis involves a step that uses the HEIDI-outlier approach to remove SNPs that have

effects on both the risk factor and the disease because of pleiotropy.

```
bzx = gsmr_data$std_
```

```
bzx     # SNP effects on the risk factor
bzx_se = gsmr_data$std_bzx_se
# standard errors of bzx
bzx_pval = gsmr_data$
```

```
bzx_pval
# p-values
for bzx
bzy = gsmr
_data$bzy
# SNP effe
cts on the
disease
bzy_se = g

4. Bi-directional GSMR

analysis

The script below runs bi-directional GSMR analyses, i.e. a forward-GSMR

analysis as described above and a reverse-GSMR analysis that uses SNPs associated

with the disease (e.g. at $p < 5e-8$) as the instruments to test for putative causal effect

of the disease on risk factor.

```

Package Document

bi_gsmr

Bi-directional GSMR analysis is composed

of a forward-GSMR analysis and a reverse-GSMR analysis that uses

SNPs associated with the disease (e.g. at < 5e-8) as the instruments to test for

> putative causal effect of the disease on the risk factor.

Usage

```
bi_gsmr(bzx
, bzx_se, b
zx_pval, bz
y, bzy_se,
bzy_pval, l
drho, snpid
, heidi_out
lier_flag=T
, gwas_thre
sh=5e-8, si
ngle_snp_he
```

```
idi_thresh=
0.01, multi
_snp_heidi_
thresh=0.01
, nsnps_thr
esh=10, ld_
r2_thresh=0
.05, ld_fdr
_thresh=0.0
5, gsmr2_be
ta=0)
```

Arguments

`bzx`

bzx_se

bzx_pval

bzy

bzy_se

bzy_pval

`ldrho`

`snpid`

n_ref

```
heidi_outlier_fl
```

gwas_thresh

```
single_snp_heidi_
```

```
multi_snp_heidi_t
```

```
nsnps_thresh
```

`ld_r2_thresh`

ld_fdr_thresh

gsmr2_beta

Value

Estimate of

causative effect of risk factor on disease (forward_bxy), the corresponding standard error

(forward_bxy_se),
p-value
(forward_bxy_pva
and SNP
index
(forward_index),
and estimate
of causative

effect of disease on risk factor (reverse_bxy), the corresponding standard error (reverse_bxy_se),

p-value (reverse_bxy_pva
SNP index (reverse_index),
SNPs with missing values, with non-

significant p-values and those in LD.

Examples

```
data("gsmr")
gsmr_result = bi_gsm
```

```
r(gsmr_dat
a$bzx, gsm
r_data$bzx
_se, gsmr_
data$bzx_p
val, gsmr_
data$bzy,
gsmr_data$
bzy_se, gs
mr_data$bz
y_pval, ld
rho, gsmr_
```

```
data$SNP,
n_ref, T,
5e-8, 0.01
, 0.01, 10
, 0.05, 0.
05, 0)
```

gsmr

GSMR (Generalised Summary-data-based Mendelian Randomisation is a flexible and powerful

approach that utilises multiple genetic instruments to test for causal association between a

risk factor and disease using summary-level data from independent genome-

> wide association studies.

Usage

```
gsmr(bzx, bzx_se, bzx_pval, bzy, bzy_se, ldr
```

```
ho, snpid,
heidi_outli
er_flag=T,
gwas_thresh
=5e-8, sing
le_heidi_th
resh=0.01,
multi_heidi
_thresh=0.0
1, nsnps_th
resh=10, ld
```

```
_r2_thresh=
0.05, ld_fd
r_thresh=0.
05, gsmr2_b
eta=0)
```

Arguments

bzx

bzx_se

`bzx_pval`

`bzy`

bzy_se

```
ldrho
```

```
snpid
```

n_ref

```
heidi_outlier_fl
```

gwas_thresh

nsnps_thresh

`ld_r2_thresh`

`ld_fdr_thresh`

gsmr2_beta

```
single_heidi_thr
```

multi_heidi_thres

Value

Estimate of causative effect of risk factor on disease (bxy), the corresponding standard error

(bxy_se), p-value (bxy_pval), SNP index (used_index), SNPs with missing values, with

non-significant p-values and those in LD.

Examples

```
data("gsmr")
gsmr_resul
```

```
t = gsmr(g
smr_data$b
zx, gsmr_d
ata$bzx_se
, gsmr_dat
a$bzx_pval
, gsmr_dat
a$bzy, gsm
r_data$bzy
_se, ldrho
, gsmr_dat
a$SNP, n.r
```

```
d$SNP, n_ref, T, 5e-8, 0.01, 0.01, 10, 0.1, 0.05, 0)
```

std_effect

Standardizatio of SNP effect and its standard error using z-statistic, allele frequency

> and sample size

Usage

```
std_effect(snp_freq, b, se, n)
```

Arguments

`snp_freq` vector, allele frequen

b

vector,
SNP
effects
risk fac

se

vector,

standar

errors c

n

vector,
SNP
sample
sizes fo
GWAS
the risk
factor

Value

Standardised effect (b) and standard error (se)

Examples

```
data("gsmr
```

```
")
std_effect
s = std_ef
fect(gsmr_
data$a1_fr
eq, gsmr_d
ata$bzx, g
smr_data$b
zx_se, gsm
r_data$bzx
_n)
```
